Data Completeness Report

Notes: (1) Variables are individually listed only if they have greater than 5% missing data. These variables are listed under the appropriate percentage category in the order in which they appear in the data file. (2) The Data Completeness Report only captures information about system missing or other values that are declared missing. Codes that have a label implying that they are missing but that are not declared missing values are not reflected in this report. Data users should consult the codebook for more specific information about missing values. (3) Some variables that have 100% missing data may have been blanked by ICPSR to protect respondent confidentiality. Data users should consult the codebook for more specific information about blanked variables. (4) Data do not contain skip patterns or skip patterns are not reflected in the data as coded.

National Longitudinal Study of Adolescent Health (Add Health), 1994-2008

Variable Description and Frequencies

Note: Frequencies displayed for the variables are not weighted. They are purely descriptive and may not be representative of the study population. Please review any sampling or weighting information available with the study.

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

H4BPFLG	S27 # OF BLOOD PRESSURE MEASURES-W4

Location: 6800-6806 (width: 7; decimal: 0)

Variable Type: numeric

Question: ~~~~~~

[NOTES:] Single systolic and diastolic measures were constructed as the average of measures 2 and 3. When one of the second and third measures was missing, the other single measure was used. In the cases when both measures 2 and 3 were missing, the first measure was used. To indicate the number of measures used in constructed blood pressure variables, the variable H4BPFLG was created.

Question:	~~~~~~

[NOTES:] Weights were measured in pounds in the pretest and have been converted to kilograms in this data file to be comparable to the main study measurements. Measured weights were compared to self reported weights and outliers were investigated. Waist, height, and sex data were used to compare and assess data quality. There are 16 cases among the outliers in the main study where the field interviewer measured weight in pounds but entered it as kilograms. H4WGT has been re-coded for these 16 cases by dividing it by 2.2 and the variable H4WTLBS created to flag the recodes. During this cleaning process some cases were also discovered that had measured weights that were inconsistent with sex, self-reported weight, waist, and height measures and were assigned the code 889.
